

A scam guardian that lives on the phone, speaks in **your** language, and catches the fraud **before** the money is gone.

Maverick Effect AI Challenge 2026

Financial Safety for Rural India · built for Bharat

ON-DEVICE

OFFLINE-READY

GUJARATI-FIRST

THE PERSON WE BUILT THIS FOR

Kamlaben lost ₹40,000 in one phone call.

She is 58, runs a kirana shop in Rajkot, and joined UPI two years ago. A caller said her account would be **frozen in one hour** unless she verified her details. He sounded official. He stayed calm. By the time her son reached home, the money was gone.

She was not careless. She is exactly the person UPI brought online — and exactly the person every scam is designed for.

₹22,000+ cr

lost to cyber fraud in India in 2024 — roughly three times the year before.

First-time UPI users

are the most targeted, and the least protected.

Almost none of it

is caught before the transfer happens.

WHY TODAY'S TOOLS MISS HER

Every existing defence assumes she reads English, trusts the cloud, and can judge a message alone.

She does none of those. That is the gap.

1

Bank alerts arrive after the theft

The SMS that says "₹40,000 debited" comes when the money has already left. Warning is not protection.

2

Cloud AI can't be trusted with a bank SMS

A tool that pastes her messages to a server is a tool she will never use. And in a village with no signal, it simply doesn't work.

3

Nobody explains the "why" — in Gujarati

A red "SCAM" label teaches nothing. She needs to know which trick was used, in words she speaks, so she catches it herself next time.

WHAT DHANRAKSHAK IS

A pocket guardian that **predicts** a scam before the money moves, **explains** the trick in plain Gujarati, and keeps working even with **no internet at all**.

01 • PREDICT

Catch it early

A message, a link, a UPI request, a call recording — checked in under a second, with the exact red flags marked on it.

02 • EXPLAIN

Teach the "why"

Real signals in, plain words out. Every warning names the tactic and cites the real RBI or NPCI advisory. Never a guess.

03 • OFFLINE

Works anywhere

The detection engine ships to the phone. No signal, no problem — her messages never leave the device.

Six things it does — one of them, no other team will have

THE ONE THAT MATTERS

Practice a scam call, safely

The app becomes the scammer — a real voice, in Gujarati — and coaches her through spotting each trick as it happens. She hangs up harder to fool than before.

★ **DETECTION PROTECTS ONCE. PRACTICE PROTECTS FOREVER.**

CHECK

Message & link scanner

Paste any SMS or WhatsApp text. Red flags get highlighted on the message itself.

SEE

Screenshot reader

Catches the classic trap: a "collect" request dressed up as money coming in.

HEAR

Voice-note check

Play a suspicious call recording; it names the tactic used.

ACT

Family & 1930

One tap to ask a relative, or to report to the cybercrime helpline.

WHY YOU CAN TRUST THE ANSWER

The AI never decides what is a scam. The maths does — the model only puts it into her words.

Because the tactics are real and the advisory is real, there is nothing left for the AI to make up. That is how a small model, running offline, stays trustworthy.

THE RURAL PROMISE, MADE REAL

No signal? It still catches the scam.

- **The real engine ships to the phone**

The same rules and the same trained model that run on our server are exported into the app. Not a demo, not a stub — the actual detector, in her pocket.

- **Instant, and private by design**

A verdict in under a tenth of a second, computed on the device. Her bank messages are never uploaded, because there is nothing to upload.

- **Online only makes it richer**

When there is signal, the server adds a fuller explanation. When there isn't, she is still protected.

We are honest about the edges: live voice practice needs a connection. Text, links and screenshots do not.

→ Airplane mode · No internet

⚠ **Scam · 94% risk**

Fake KYC. A real bank never freezes an account over a call.

Dear customer, your KYC has expired .
Account will be frozen today 6 PM .
Verify now: [sbi-kyc-verify.online](#) . Share
OTP to confirm.

✓ **Checked on your device —
nothing left the phone**

THE FEATURE THAT WINS THE ROOM

A scammer calls. She practises hanging up on him — safely.

The app plays the fraudster in a real voice, in Gujarati, and she has to talk her way out. A coach steps in after each reply to name the trick. **The call feels real because it answers in under a second.** Here is how:

She stops talking

The phone hears her instantly — recognition runs on the device, nothing to upload.

0 ms

→

Caller answers back

A short, ready line plays at once ("Haan, suniye...") so there is no dead air.

~150 ms

→

Real reply flows in

The model's tailored response is spoken over the top — reacting to exactly what she said.

< 1 s

And no two calls are ever the same — the scenario is re-rolled every session, so she learns to spot the **tactic**, not memorise a script.

DESIGNED FOR PEOPLE APPS USUALLY FORGET

If she can't use it, it doesn't matter how clever it is.

Language is the first screen

She picks Gujarati before anything else — in her own script, read aloud if she taps it.

It talks, so reading isn't required

Every step and every verdict can be spoken. Built for people who never learned to read a screen.

An elder mode that means it

Bigger text, bigger buttons, one thing at a time. Her son sets it once; she never touches a setting again.

"Which language do you speak?"

ગુજરાતી

Gujarati · default

हिंदी

Hindi

English

So what makes us different?

Most teams will build a clever chatbot. We built something she can actually trust.

THE USUAL APPROACH

A cloud chatbot

- ✗ Sends her bank SMS to a server somewhere
- ✗ Dies the moment the signal drops
- ✗ Answers in English, if at all
- ✗ Says "scam" but never why
- ✗ Catches one message, teaches nothing

DHANRAKSHAK

A guardian on her phone

- ✓ Runs on the device — her messages stay hers
- ✓ Works with no internet at all
- ✓ Speaks and explains in Gujarati
- ✓ Names the tactic and cites the real advisory
- ✓ Trains her, by voice, to spot the next one herself

Under the hood

Four kinds of input, one engine, one honest answer — and it all fits on a phone.

The build, in plain terms

— why each piece is there

Next.js PWA	Installs like an app, opens offline, runs on a ₹7,000 Android.	Rules + LightGBM	Small and explainable — every verdict traces to a named trick. Tiny enough to run on the phone.
FastAPI backend	Typed and quick. The verdict is out in under 150 ms.	Qwen (local) + Groq	The same code speaks two ways: a local model for the offline demo, a hosted one so the live link never sleeps.
Chroma + advisories	So every "what to do" is quoted from RBI / NPCI, not invented.	Whisper + edge-tts	Turns the practice call into a real voice, in Gujarati, both ways.
Stateless • no database	Nothing is stored, so privacy isn't a promise — it's the architecture. Scaling is just adding a copy.	Docker	One command brings the whole thing up, the same way every time.

WHY IT CAN ACTUALLY REACH MILLIONS

Cheap to run, easy to spread, and useful the day it ships.

₹0

recurring cost. Open tools, a local model, no cloud bill. A district administration could hand it out for free.

1 phone

protects a family. "Ask my son" is one tap — one careful person shields the whole household.

3 langs

today, more tomorrow. Gujarati, Hindi, English now; the same design drops into any Indian language.

This isn't a demo that dies after the pitch. Our own parents can install it tonight — and be a little harder to fool tomorrow.

WATCH THIS AT THE DEMO

We turn the phone to **airplane mode**. No wifi, no SIM. We paste a scam. It flags every red flag and explains it — in Gujarati, in under a second. Her messages never left her hand.

Predict. Explain.
Even with no internet.
